Tables and Eonts

Daniel Anderson

Week 8, Class 1

Data viz in the wild

Sarah Donaldson

Hyeonjir

Anwesha & Ping on deck

Agenda

- Tables with gt
- Fonts with showtext and/or extrafont

Learning objectives

- Be comfortable with the basics of gt
 - o create a table
 - format columns
 - create spanner heads
 - o etc.
- Understand how to use additional fonts (if you so choose)

Overview

- Pipe-oriented
- Beautiful tables easy
- Spanner heads/grouping used to be a total pain not so anymore
- Renders to HTML/PDF without even thinking about it

Probably my favorite package for creating static tables, although **kableExtra** is great too.

My experience is that fewer people are generally familiar with **gt**, which is why I cover it here.

Install

```
install.packages("gt")
# or
remotes::install_github("rstudio/gt")
```

The hard part

- Getting your data in the format you want a table in
- Utilize your pivot_* skills regularly

library(fivethirtyeight) flying

```
## # A tibble: 1,040 x 27
##
     respondent id gender age height
                                       children under 18 household incom
##

                                             15
## 10 Male Always
                                11
                                      14
                                             21
                                                   14
```

Turn into table

```
library(gt)
smry %>%
  gt()
```

Disclaimer: these all look slightly different on the slides

gender	recline_frequency	18-29	30-44	45-60	> 60
Female	Never	24	21	19	23
Female	Once in a while	36	25	30	36
Female	About half the time	10	22	18	17
Female	Usually	13	22	26	28
Female	Always	10	21	29	12
Male	Never	24	17	20	18
Male	Once in a while	19	39	40	29
Male	About half the time	11	11	16	11
Male	Usually	14	30	15	27
Male	Always	11	14	21	14

Add gender as a grouping variable

```
smry %>%
  group_by(gender) %>%
  gt()
```

recline_frequency	18–29	30-44	45-60	> 60
Female				
Never	24	21	19	23
Once in a while	36	25	30	36
About half the time	10	22	18	17
Usually	13	22	26	28
Always	10	21	29	12
Male				
Never	24	17	20	18
Once in a while	19	39	40	29
About half the time	11	11	16	11
Usually	14	30	15	27
Always	11	14	21	14

This is an example of a table that looks better with the default CSS

Add a spanner head

```
smry %>%
  group_by(gender) %>%
  gt() %>%

tab_spanner(
  label = "Age Range",
  columns = vars(`18-29`, `30-44`, `45-60`, `> 60`)
)
```

realine frequency	Age Range						
recline_frequency	18-29	30-44	45-60	> 60			
Female							
Never	24	21	19	23			
Once in a while	36	25	30	36			
About half the time	10	22	18	17			
Usually	13	22	26	28			
Always	10	21	29	12			
Male							
Never	24	17	20	18			
Once in a while	19	39	40	29			
About half the time	11	11	16	11			
Usually	14	30	15	27			
Always	11	14	21	14			

Change column names

```
smry %>%
  group_by(gender) %>%
  gt() %>%
  tab_spanner(
    label = "Age Range",
    columns = vars(`18-29`, `30-44`, `45-60`, `> 60`)
) %>%
  cols_label(recline_frequency = "Recline")
```

Recline		Age Range						
Recline	18–29	30-44	45-60	> 60				
Female								
Never	24	21	19	23				
Once in a while	36	25	30	36				
About half the time	10	22	18	17				
Usually	13	22	26	28				
Always	10	21	29	12				
Male								
Never	24	17	20	18				
Once in a while	19	39	40	29				
About half the time	11	11	16	11				
Usually	14	30	15	27				
Always	11	14	21	14				

Align columns

They are already left-aligned because of the CSS, but that's not typical

Recline	Age Range						
Recline	18–29	30-44	45-60	> 60			
Female							
Never	24	21	19	23			
Once in a while	36	25	30	36			
About half the time	10	22	18	17			
Usually	13	22	26	28			
Always	10	21	29	12			
Male							
Never	24	17	20	18			
Once in a while	19	39	40	29			
About half the time	11	11	16	11			
Usually	14	30	15	27			
Always	11	14	21	14			

Add a title

Airline Passengers							
Leg space is limited, what do you do?							
Recline		Age R	ange				
	18-29	30-44	45-60	> 60			
Female							
Never	24	21	19	23			
Once in a while	36	25	30	36			
About half the time	10	22	18	17			
Usually	13	22	26	28			
Always	10	21	29	12			
Male							
Never	24	17	20	18			
Once in a while	19	39	40	29			
About half the time	11	11	16	11			
Usually	14	30	15	27			
Always	11	14	21	14			

Format columns

```
smrv %>%
 mutate(across(c(`18-29`, `30-44`, `45-60`, `> 60`),
                ~.x/100)) %>%
  group_by(gender) %>%
  gt() %>%
 tab_spanner(
   label = "Age Range",
    columns = vars(`18-29`, `30-44`, `45-60`, `> 60`)
  ) %>%
 fmt_percent(
   vars(`18-29`, `30-44`, `45-60`, `> 60`),
    decimals = 0
  ) %>%
  cols_label(recline_frequency = "Recline") %>%
  cols_align(align = "left",
             columns = vars(recline frequency)) %>%
  tab_header(
   title = "Airline Passengers",
    subtitle = "Leg space is limited, what do you do?"
```

Airline Passengers							
Leg space is limited, what do you do?							
Recline		Age R	ange				
	18–29	30–44	45–60	> 60

Data from fivethirty	eight							

What else?

- Lots more it can do, and lots more in development
- See the website

Thomas Mock does a lot of great work with tables and often has tutorials showing your how to go further (e.g., see here and here).

A few other table options

kableExtra

A few quick examples

Make sure to specify **results** = "asis" in your chunk options.

```
library(knitr)
library(kableExtra)
dt <- mtcars[1:5, 1:6]
kable(dt) %>%
   kable_styling("striped") %>%
   column_spec(5:7, bold = TRUE
```

Function reference

flextable R package

The flextable package provides a framework for easily create tables for reporting and publications. Tables can be embedded within:

- R Markdown documents with support for HTML, Word and PowerPoint documents.
- · Microsoft Word or PowerPoint documents
- PDF documents with package pagedown (it's only HTML)

Tables can also be rendered as R plots or graphic files (png, pdf and jpeg).

Getting Started

An API is available to let R users create tables for reporting and control their formatting properties and their layout. A flextable object is a data.frame representation, it can be manipulated with functions that give control over:

Fonts

General advice

- Use different fonts to distinguish things
 - Specifically code
 - Consider different fonts for different heading levels, and/or to distinguish headers from the body
- Always choose a sans—serif font for code
- Explore and try it makes a big impact on the overall look/feel (bigger than you may expect if you haven't played with fonts much before)
- Try not to get sucked into too deep of a rabbit hole

Google fonts

https://fonts.google.com

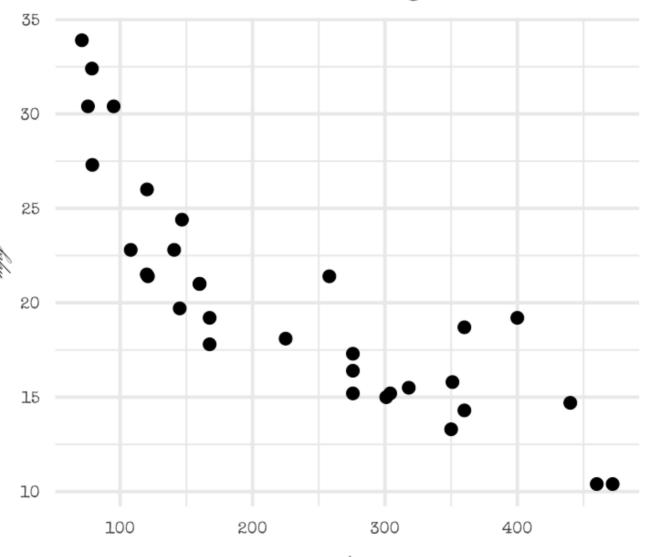

- Open source, designed for the web
- Good place to explore fonts
- Can be incorporated via the {showtext} package!

{showtext} example

```
devtools::install github("vixuan/showtext")
library(showtext)
font_add_google('Monsieur La Doulaise', "mld")
font_add_google('Special Elite', "se")
showtext auto()
quartz()
ggplot(mtcars, aes(disp, mpg)) +
  geom point() +
  labs(title = "An amazing title",
       subtitle = "with the world's most boring dataset") +
  theme(plot.subtitle = element_text(size = 18, family = "se"),
        plot.title = element_text(size = 22, family = "mld"),
        axis.title = element_text(size = 18, family = "mld"),
        axis.text.x = element_text(size = 12, family = "se"),
        axis.text.y = element_text(size = 12, family = "se"))
```

An amazing title

with the world's most boring dataset

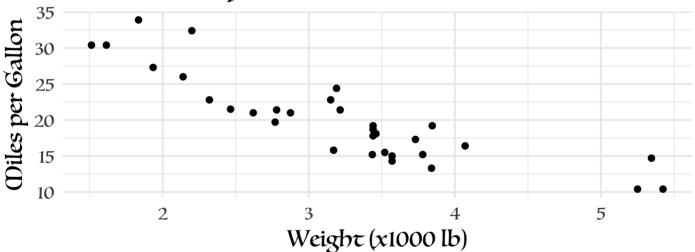

extrafont

- Primary downside you have to have the fonts installed on your computer
- Look at the install documentation it's pretty good and fairly comprehensive

```
library(extrafont)
# font_import() Only need to run once
fonts() # list fonts
```

```
".SF Compact Display"
## [1] "Roboto Condensed"
                                          ".SF Compact Text"
## [3] ".SF Compact Rounded"
   [5] ".Keyboard"
                                          ".New York"
##
##
   [7] "System Font"
                                          ".SF NS Mono"
##
    [9] ".SF NS Rounded"
                                          "Andale Mono"
##
    [11] "Apple Braille"
                                          "AppleMyungjo"
    [13] "Arial Black"
##
                                          "Arial"
   [15] "Arial Narrow"
##
                                          "Arial Rounded MT Bold"
##
    [17] "Arial Unicode MS"
                                          "Bodoni Ornaments"
##
    [19] "Bodoni 72 Smallcaps"
##
    [21] "Brush Script MT"
                                          "Comic Sans MS"
    [23] "Courier New"
##
                                          "DIN Alternate"
```

Fuel Efficiency of 32 Cars

Why fonts matter

A few examples of epic fails

h/t Will Chase

Megaflicks

Quick aside

Change the font of your R Markdown!

Create a new text file, import the text there, write a tiny bit of css.

```
@import url('https://fonts.googleapis.com/css?family=Akronim&disp
body {
   font-family: 'Akronim', cursive;
}
```

Save this in a new file in the same directory.

Modify Rmd YAML

You need to have the CSS file in the same directory as your Rmd, then reference it with

```
output:
  html_document:
    css: custom.css
```

Here I'm assuming the file you saved before is called "custom.css".

Render!

Alternative approach

It's good to think more about CSS and how it links with everything HTML. We'll talk about this a bit more next week. But, if you only have a little bit of CSS you need to write, you can do it right within RMarkdown!

I actually did this for these slides to make the tables a bit smaller!

```
24
25 * ```{css echo = FALSE}
26 * table {
27    font-size: 1rem;
28 * }
29 * ```
```

Resource for learning more

• I'm not an expert on fonts. I have mostly just picked what looks nice to me.

Best I've heard of is practical typography

Identify fonts

Use others work to help you — I found the font for these slides from a different theme that I liked.

Use google chrome's developer tools to help!
